## 1 Executive Summary

### 1.1 Repository Overview

This analysis examines three repositories intended to form a coherent physics engine and numerical algorithms library:

#### **Jet Fluid Engine (doyubkim-fluid-engine-dev)**

Production-grade fluid simulation with SPH, FLIP/PIC/APIC, grid-based solvers, level sets, and FDM linear system solvers. Strong in computational physics but lacks rigid body dynamics.

- **Game Physics Cookbook (packtpublishing-game-physics-cookbook):** Rigid body physics with SAT collision detection, impulse-based response, cloth simulation, and spatial partitioning. Strong in game physics but lacks advanced numerical methods.

#### **Numerical Recipes (notoriousjavy-delete)**

Collection of numerical algorithms including ODE solvers (RK4), integration routines, linear solvers, and statistical functions. Standalone algorithms without physics framework integration.

### 1.2 Key Findings

#### **Critical Gap**

No unified constraint solver architecture bridges rigid bodies and fluids

#### **Major Overlap**

Duplicate math primitives (vec2/vec3/mat4 vs Vector2/Vector3/Matrix) requiring unification

#### **Architectural Mismatch**

Different coordinate conventions, memory layouts, and integration patterns

#### **Partial Implementation**

Broadphase collision limited to QuadTree/Octree; no sweep-and-prune or dynamic BVH

### 1.3 Strategic Recommendation

Adopt Jet's modular architecture as the foundation, integrate Game Physics Cookbook's rigid body system as a new module, and incorporate Numerical Recipes algorithms into a unified MathPrimitives/Numerics layer. Estimated total effort: 16-24 person-months for full integration.

## 2 Capability Coverage Matrix

Legend: ✓ = Implemented — ◦ = Partial — × = Missing — ★ = Duplicate

Table 1: Core Math &amp; Numerics — Capability Coverage

Capability	Jet	Cookbook	NumRecipes
Vector/Matrix/Quaternion	✓Vector2/3, Matrix, Quaternion	*vec2/3, mat2/3/4	×
Transform Types	✓Transform2/3	◦mat4 functions	×
Dense Linear Algebra	◦Basic ops	✓Inverse, Determinant	×
Sparse Linear Solvers	✓CG, ICCG, Jacobi, MG	×	◦tridag, sor
SVD/Eigendecomp	✓svd.h	×	×
ODE Solvers	◦Semi-implicit Euler	◦Euler/Verlet	✓rk4, stepper
Numerical Integration	×	×	✓qgaus, romberg, quad3d
Interpolation/Splines	✓Cubic interpolation	×	✓interp_linear, savgol
Random/Sampling	×	◦Basic Random()	✓multinormaldev, ranpt

## 2.1 Core Math & Numerics

## 2.2 Rigid Body Physics

Table 2: Rigid Body Physics — Capability Coverage

Capability	Jet	Cookbook	NumRecipes
Rigid Body State	◦RigidBodyCollider (static)	✓RigidbodyVolume	×
Mass Properties/Inertia	×	✓InvMass, inertia	×
Broadphase Collision	✓PointHashGrid, KdTree	✓QuadTree, Octree	×
Narrowphase (GJK/EPA)	×	×	×
Narrowphase (SAT)	×	✓SAT for OBB	×
Contact Manifold	×	✓CollisionManifold	×
Impulse Resolution	×	✓ApplyImpulse()	×
Friction/Restitution	×	◦bounce param	×
Constraints/Joints	×	◦DistanceJoint	×
Sequential Impulses/PGS	×	◦ImpulseIteration loop	×
Sleeping/Islands	×	×	×
CCD (Continuous)	×	×	×

## 2.3 Soft Body / Cloth / Particles

## 2.4 Fluids

# 3 Gap List

## 3.1 Critical Gaps (High Severity)

### 3.1.1 Gap 1: GJK/EPA Narrowphase Collision

**Description** No Gilbert-Johnson-Keerthi or Expanding Polytope Algorithm for convex hull collision. SAT implementation only handles box primitives.

Table 3: Soft Body / Cloth / Particles — Capability Coverage

Capability	Jet	Cookbook	NumRecipes
Particle System Data	✓ParticleSystemData2/3	✓Particle class	×
Mass-Spring Cloth	×	✓Cloth.h with springs	×
Bending/Shear Springs	×	✓SetBendSprings, SetShearSprings	×
Constraint Solving	×	✓SolveConstraints()	×
Position-Based Dynamics	×	×	×

Table 4: Fluids — Capability Coverage

Capability	Jet	Cookbook	NumRecipes
Grid-Based Eulerian	✓GridFluidSolver2/3	×	×
Advection Solvers	✓SemiLagrangian, Cubic	×	×
Pressure Projection	✓GridPressureSolver	×	×
Diffusion	✓Forward/Backward Euler	×	×
SPH	✓SphSolver2/3	×	×
PCISPH	✓PciSphSolver2/3	×	×
FLIP/PIC/APIIC	✓FlipSolver, ApicSolver	×	×
Level Sets	✓LevelSetSolver, FMM, ENO	×	×
Marching Cubes	✓marching_cubes.h	×	×
Boundary Conditions	✓Blocked, Fractional	×	×

**Current State**

Missing entirely. Cookbook has SAT for OBB/AABB but not general convex shapes.

**Target Module**

Geometry (or new CollisionDetection module)

**Impact**

Correctness - Cannot handle arbitrary convex colliders required for realistic rigid body simulation

**Implementation**

Implement GJK with Minkowski difference, EPA for penetration depth, warm-starting with cached simplices

**Acceptance**

Unit tests for sphere-sphere, box-box, convex-convex; benchmark vs SAT

**Effort**

Large (3-4 weeks)

**3.1.2 Gap 2: Unified Constraint Solver****Description**

No centralized constraint solver architecture. Cookbook has ad-hoc impulse iteration; Jet has FDM solvers but no rigid body constraint support.

**Current State**

Partial - ImpulseIteration loop in PhysicsSystem.cpp but no proper PGS/MLCP formulation

**Target Module**

New ConstraintSolver module

**Impact**

Correctness/Stability - Joint stacking, complex constraint scenarios fail

**Implementation**

Sequential Impulses with warm-starting, constraint graph, bias factors, Baumgarte stabilization

**Acceptance**

Stack of 10+ boxes stable; pendulum chain test; joint motor accuracy

**Effort**

Large (4-5 weeks)

**3.1.3 Gap 3: Continuous Collision Detection (CCD)****Description**

No time-of-impact calculation for fast-moving objects. Tunneling occurs at high velocities.

**Current State**

Missing entirely in all repositories

**Target Module**

CollisionDetection

**Impact**

Correctness - Bullets, fast projectiles pass through thin walls

**Implementation**

Conservative advancement with GJK, speculative contacts, TOI root finding

**Acceptance** High-velocity sphere vs thin plane test; frame-rate independent collision

**Effort** Medium (2-3 weeks)

**3.1.4 Gap 4: Island Management & Sleeping**

**Description** No grouping of interacting bodies into islands or sleep state management for stationary objects.

**Current State**  
Missing entirely

**Target Module**  
PhysicsCore

**Impact** Performance -  $O(n^2)$  collision checks for all bodies regardless of activity

**Implementation**  
Union-find for islands, velocity/energy threshold for sleeping, wake propagation

**Acceptance** 100 stacked boxes achieve 60fps; proper wake-on-impact

**Effort** Medium (2 weeks)

**3.2 Medium Severity Gaps****3.2.1 Gap 5: Advanced Joint Types**

**Description** Only DistanceJoint implemented. Missing hinge, slider, ball-socket, motors, limits.

**Current State**  
Partial - DistanceJoint.h exists (Evidence: Code/DistanceJoint.h)

**Implementation**  
Derive from base Constraint class; implement position/velocity constraints with Jacobians

**Effort** Medium (2-3 weeks per joint type)

**3.2.2 Gap 6: Position-Based Dynamics (PBD)**

**Description** No PBD implementation for unified soft/rigid body simulation.

**Current State**  
Missing - Cloth uses spring-damper model, not PBD constraints

**Implementation**  
XPBD with compliant constraints, iterative projection, damping

**Effort** Large (4+ weeks)

### 3.2.3 Gap 7: Dynamic BVH / Sweep-and-Prune

**Description** Broadphase limited to QuadTree/Octree. No dynamic AABB tree or incremental SAP.

**Current State** Partial - Static BVH in Geometry3D.h (BVHNode struct), QuadTree/Octree in Scene.h

**Implementation** Self-balancing AABB tree with incremental updates, or sorted axis lists with insertion sort

**Effort** Medium (2 weeks)

## 4 Overlap/Conflict List

### 4.1 Math Type System Duplication

**Overlap** Jet uses Vector2<sub>i</sub>T<sub>i</sub>/Vector3<sub>i</sub>T<sub>i</sub>/Matrix3x3<sub>i</sub>T<sub>i</sub>/Quaternion<sub>i</sub>T<sub>i</sub> (templated). Cookbook uses vec2/vec3/mat2/mat3/mat4 (float-only structs).

**Evidence** Jet: include/jet/vector.h, include/jet/matrix.h. Cookbook: vectors.h, matrices.h

**Risk** Type mismatches at module boundaries, implicit conversions causing bugs, maintenance burden

**Recommendation** Adopt Jet's templated types as canonical. Create thin adapters vec2 → Vector2F, mat4 → Matrix4x4F. Gradually migrate Cookbook code.

**Migration** Phase 1: typedef aliases. Phase 2: Replace usages. Phase 3: Remove Cookbook math headers.

### 4.2 Particle System Data Structures

**Overlap** Jet's ParticleSystemData2/3 vs Cookbook's Particle class

**Evidence** Jet: include/jet/particle\_system\_data.h. Cookbook: Particle.h

**Risk** Memory layout conflicts, incompatible neighbor search

**Recommendation** Keep both but establish clear boundaries: Jet for fluid particles, Cookbook for rigid/cloth particles. Create common IParticle interface if unified iteration needed.

### 4.3 Coordinate System / Handedness

**Conflict** Jet does not explicitly define handedness. Cookbook uses left-handed OpenGL conventions with Y-up.

**Evidence** Cookbook matrices.cpp: Projection(), LookAt() assume OpenGL conventions

**Risk** Incorrect physics when mixing modules; inverted normals in collision

**Recommendation**

Document and enforce right-handed Y-up convention throughout. Add coordinate transform utilities at module boundaries.

## 4.4 Neighbor Search Structures

**Overlap** Jet: PointHashGridSearcher, PointKdTreeSearcher. Cookbook: QuadTree, Octree (Scene.h)

**Recommendation**

Consolidate into SpatialPartitioning module. Use Jet's parallel hash grid for SPH, Cookbook's Octree for broadphase rigid body.

# 5 Architectural Misalignment Findings

## 5.1 Module Boundary Violations

**Issue** Cookbook's Geometry3D.h is a monolithic 4000+ line header containing collision detection, spatial structures, mesh handling

**Decomposition Target**

Should be split per module view: primitives → Geometry, BVH → SpatialPartitioning, collision → CollisionDetection

**Refactor** Extract struct definitions to primitives.h, BVH to bvh.h, collision tests to collision.h

**Issue** PhysicsSystem.cpp directly accesses RigidbodyVolume internals (position, orientation)

**Decomposition Target**

PhysicsCore should use abstract Rigidbody interface

**Refactor** Introduce IRigidbody interface with GetPosition(), SetPosition(), GetInverseMass() etc.

## 5.2 Dependency Direction Issues

**Issue** Cookbook's rendering code (FixedFunctionPrimitives) embedded in physics demos, creating circular dependency

**Required** Rendering should depend on Physics, not vice versa

**Refactor** Move all Render() methods to separate visualization module; physics types return geometry data only

## 5.3 Missing Abstractions

### ISurface Interface

Jet has Surface2/3 base classes; Cookbook lacks equivalent abstraction for collision shapes

### IIntegrator Interface

No common interface for Euler/Verlet/RK4 integration; hardcoded in each system

### IConstraint Interface

DistanceJoint is concrete class; no base Constraint type for solver to iterate

## 6 Prioritized Roadmap

### 6.1 Phase 0: Safety & Baseline (4-6 weeks)

*Goal: Establish testing infrastructure, determinism, and documentation baseline*

#### CI/CD Pipeline

GitHub Actions for build/test on Linux/Windows/macOS

#### Unit Test Framework

Adopt Google Test; port existing tests; achieve 60% coverage on math primitives

#### Determinism Audit

Fixed-point RNG seeds; verify bitwise reproducibility across platforms

#### Module README Files

Document public API, usage examples for each module

**Acceptance** All CI green; same simulation produces identical results on all platforms

### 6.2 Phase 1: Core Math Unification (3-4 weeks)

*Goal: Single source of truth for math types and operations*

#### Math Type Consolidation

Jet templates as base; adapter headers for Cookbook compatibility

#### Numeric Utilities Integration

Port relevant NumRecipes algorithms (rk4, romberg) to Jet's namespace

#### Coordinate System Documentation

Enforce right-handed Y-up; add transform utilities

**Acceptance** Single math.h header usable by all modules; numerical precision tests pass

### 6.3 Phase 2: Rigid Body Integration (6-8 weeks)

*Goal: Production-quality rigid body module integrated with Jet architecture*

#### **Rigid Body Module**

Port Cookbook's RigidbodyVolume, adapt to Jet's coding style

#### **GJK/EPA Implementation**

Full convex collision with warm-starting

#### **Sequential Impulses Solver**

Replace ad-hoc iteration with proper SI implementation

#### **Joint System**

Distance, Hinge, Ball-socket with motors and limits

**Acceptance** Box stacking demo stable; ragdoll example working; benchmark vs Box2D/Bullet

### 6.4 Phase 3: Collision Optimization (4-5 weeks)

*Goal: Scalable broadphase and optional CCD*

#### **Dynamic BVH**

Self-balancing AABB tree with incremental updates

#### **Island Management**

Union-find islands with sleeping

#### **CCD Implementation**

Conservative advancement; speculative contacts

**Acceptance** 1000 body scene at 60fps; no tunneling with fast projectiles

### 6.5 Phase 4: Advanced Features (8+ weeks)

*Goal: Unified soft body, fluid coupling, and production polish*

#### **PBD/XPBD System**

Unified cloth/soft body with compliant constraints

#### **Fluid-Rigid Coupling**

Two-way interaction between SPH/FLIP and rigid bodies

#### **GPU Acceleration**

CUDA/OpenCL kernels for broadphase and solver

#### **Profiling Integration**

Tracy/Optick markers throughout pipeline

**Acceptance** Cloth-fluid interaction demo; GPU 10x speedup on appropriate workloads

## 7 Recommended Module Decomposition Updates

Based on this analysis, the following updates to the module decomposition are recommended:

## 7.1 New Modules to Add

### **RigidBody Module**

Rigid body state, mass properties, inertia tensor management (from Cookbook)

### **CollisionDetection Module**

Broadphase (BVH, SAP), narrowphase (GJK/EPA, SAT), contact manifold generation

### **ConstraintSolver Module**

Sequential impulses, constraints interface, joint implementations, islands

### **Numerics Module**

ODE integrators, quadrature, root finding (consolidate from NumRecipes)

## 7.2 Revised Dependency Graph

Proposed layer ordering (lower depends on higher):

**Layer 0: CoreFoundation**

**Layer 1: MathPrimitives, Numerics**

**Layer 2: Geometry, Fields**

**Layer 3: CollisionDetection, Grids**

**Layer 4: RigidBody, Particles**

**Layer 5: ConstraintSolver, Solvers (Fluid)**

**Layer 6: Animation, PhysicsWorld (unified)**

**Layer 7: Serialization, Bindings, Examples**

## 7.3 Key Interfaces to Define

*End of Gap Analysis Report*

Table 5: Key Interfaces to Define

Interface	Module	Purpose
ICollider	CollisionDetection	Abstract collision shape with support mapping
IBroadphase	CollisionDetection	Query interface for spatial acceleration
IConstraint	ConstraintSolver	Base for all constraints and joints
IIntegrator	Numerics	Step function for various ODE methods
IRigidBody	RigidBody	State access for physics world iteration
IPhysicsWorld	Animation	Unified world managing rigid + fluid + soft
